

Terminology of Computing Environments

Prof. Pai H. Chou

National Tsing Hua University

Terms

- Terminal
- Shell, Bash
- Text editor, Vim
- Python interpreter
- Terminal Emulator
- PC, Local shell, local software
- IDLE
- Jupyter Notebook

Terminal

- A keyboard + a text display
- Physically connected to a computer (in the computer room)

Computer

Terminal

Operating System (OS)

- The software that manages a computer's resources
 - computing, input/output, storage,
 - e.g.: Unix (macOS, Linux), Windows

Shell

- A command interpreter program
 - Unix-like shells: sh, csh, bash, ksh, ...
 - Windows shells: DOS, PowerShell, ...
 - Graphical shells: Windows, iOS, macOS, Android

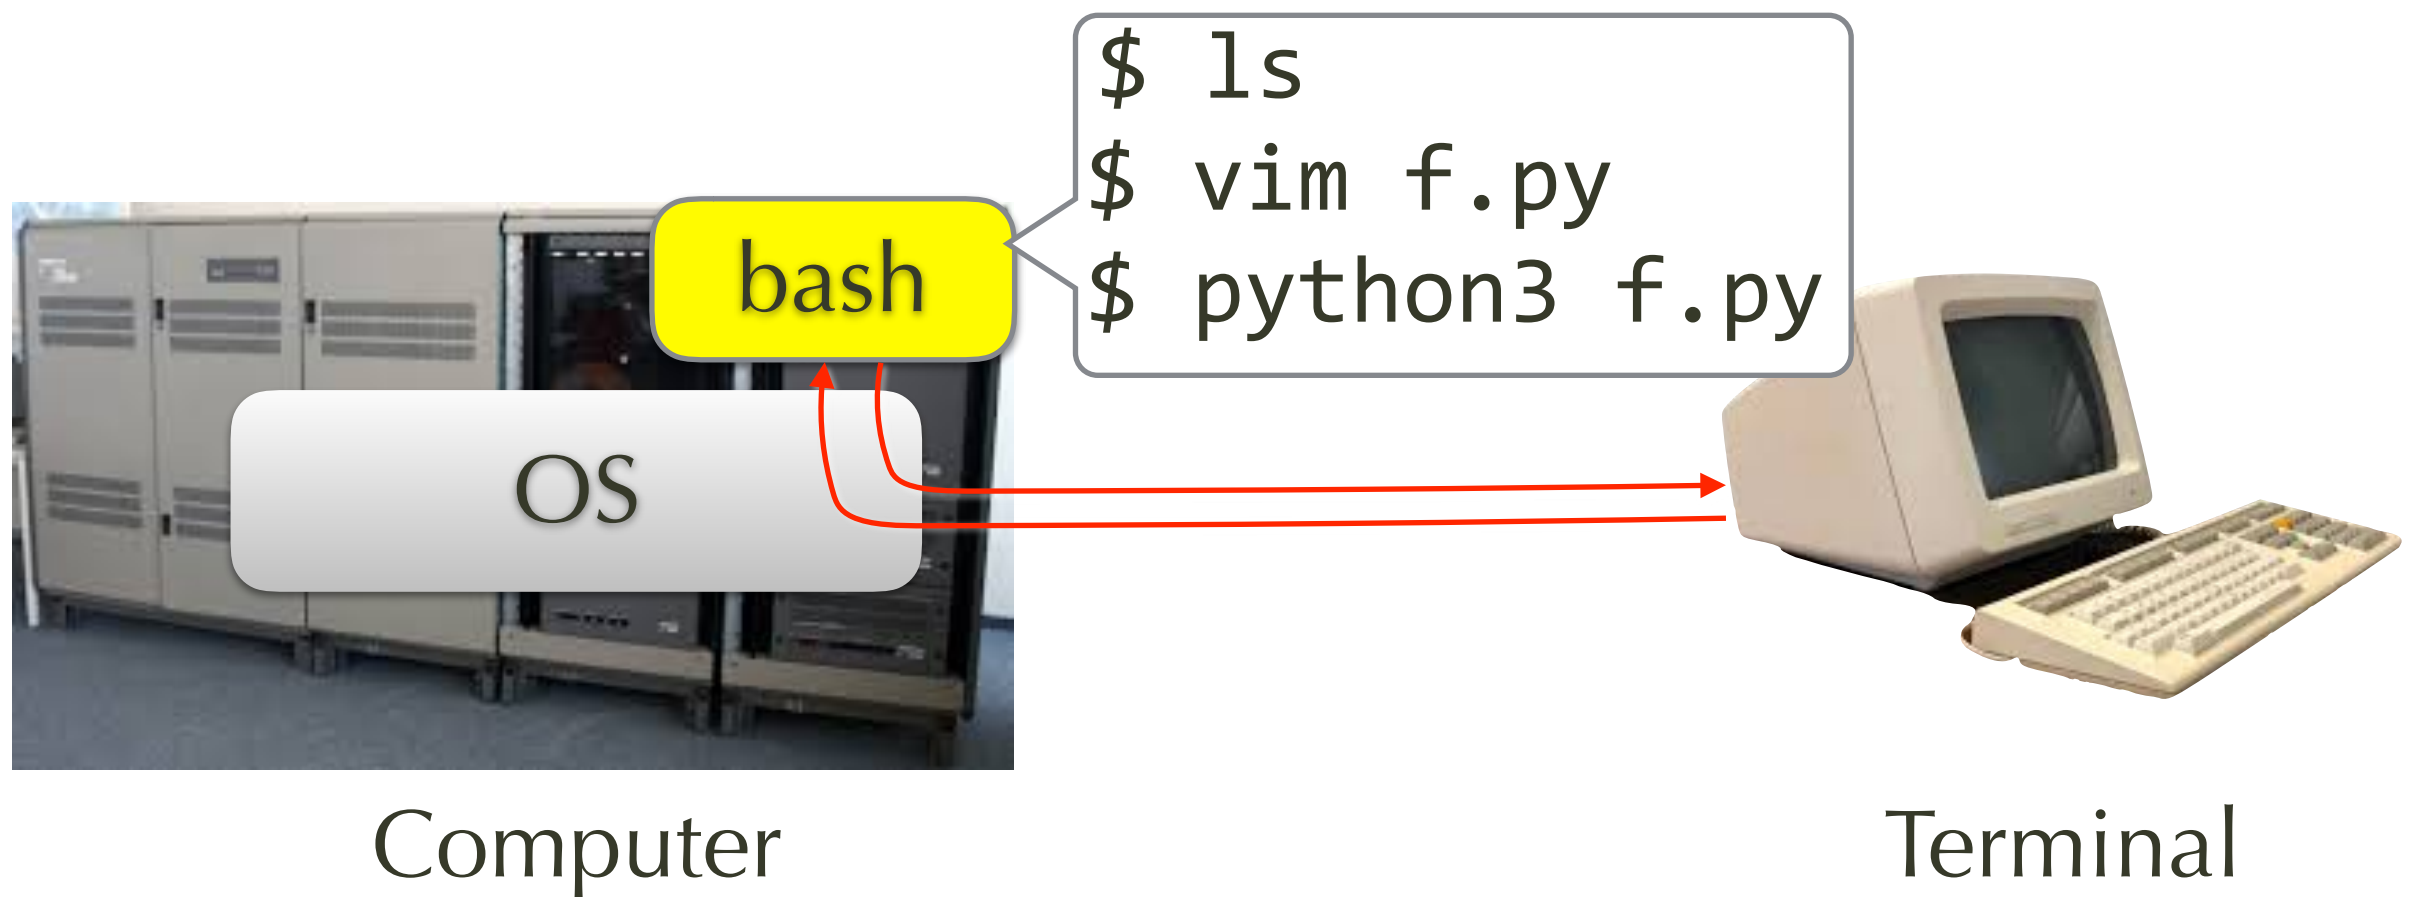

What can a shell do?

- Interpret commands
- Launch programs
 - copy/rename files, list files
 - run text editor, file transfer, ...
 - run Python interpreter, run another shell, ...
- Suspend, stop (kill) running programs

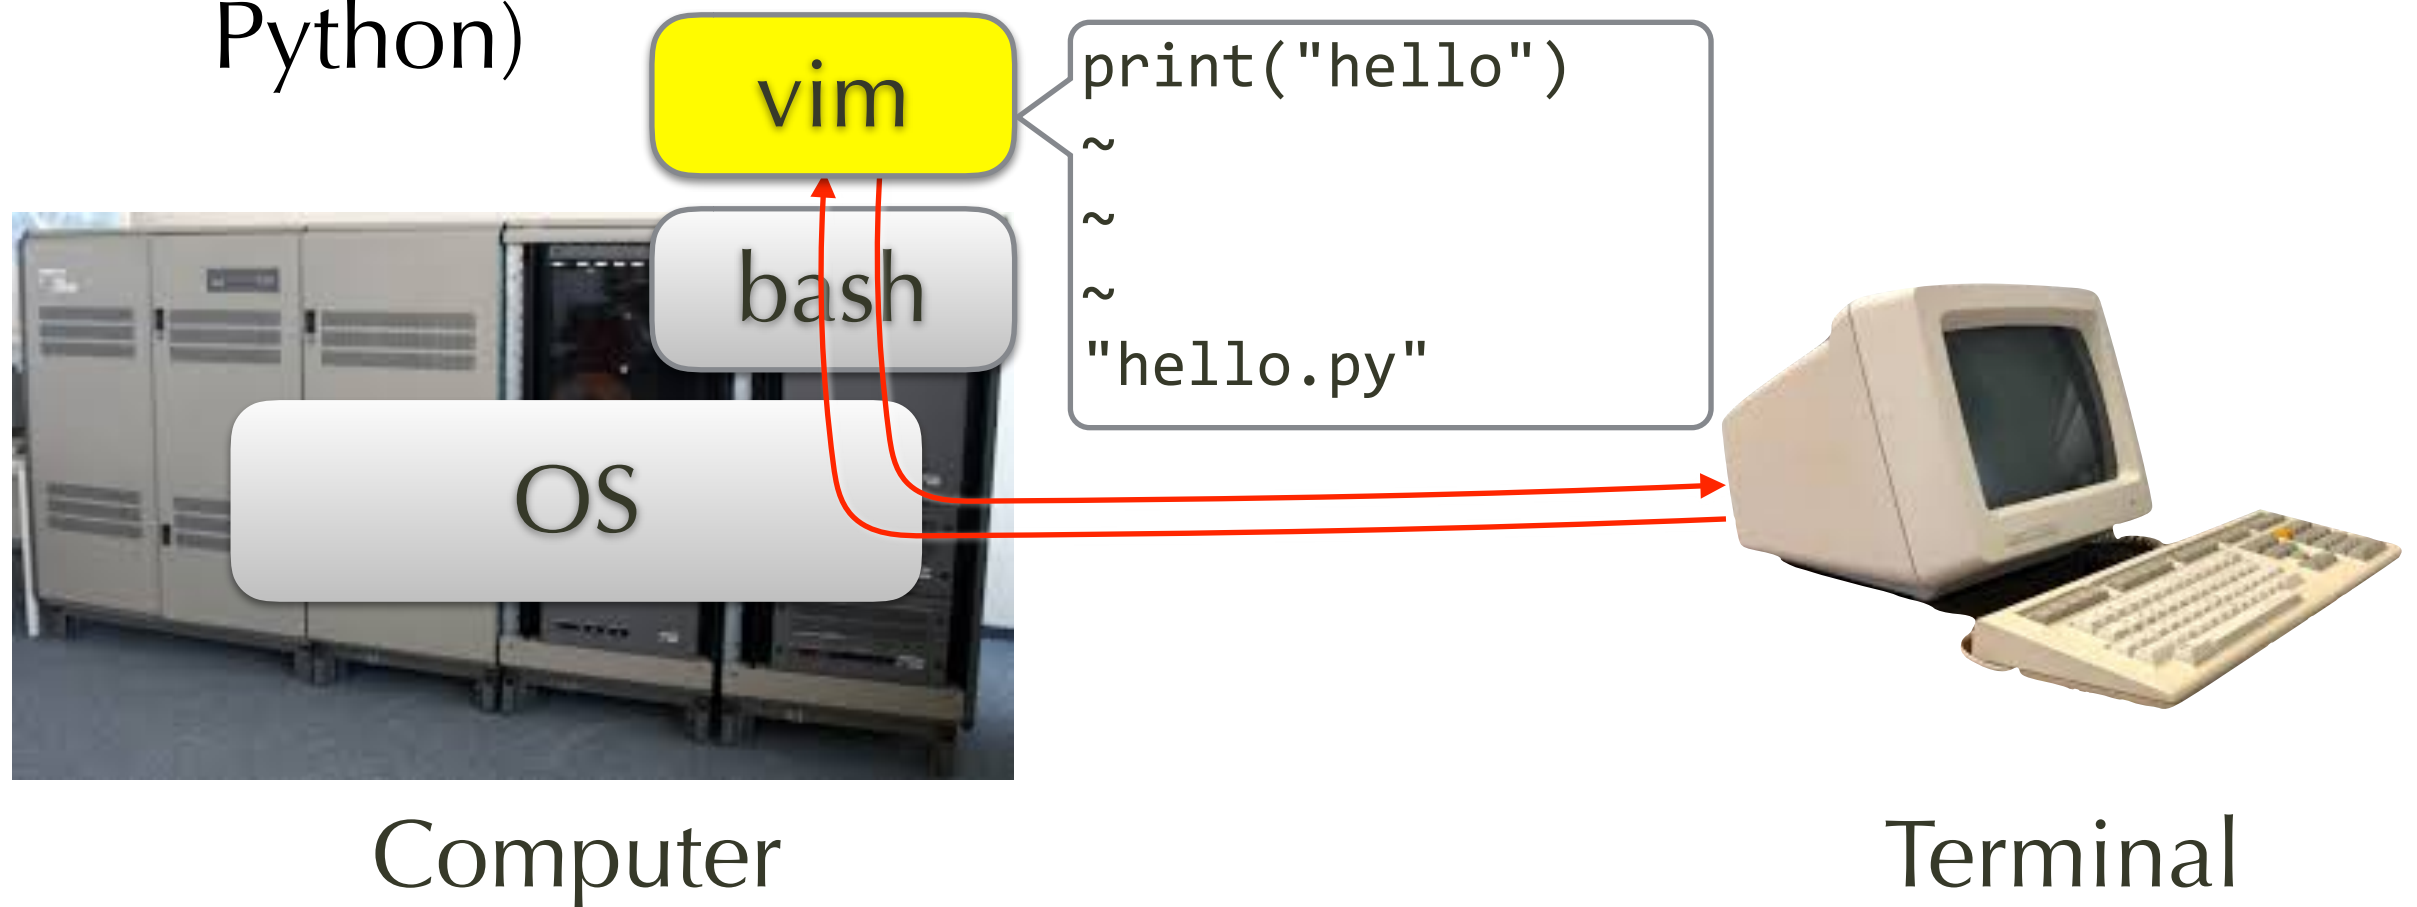

Bash

- A Unix-like shell
 - "Bourne-Again Shell"
 - Open-source, most popular, runs on most OS's

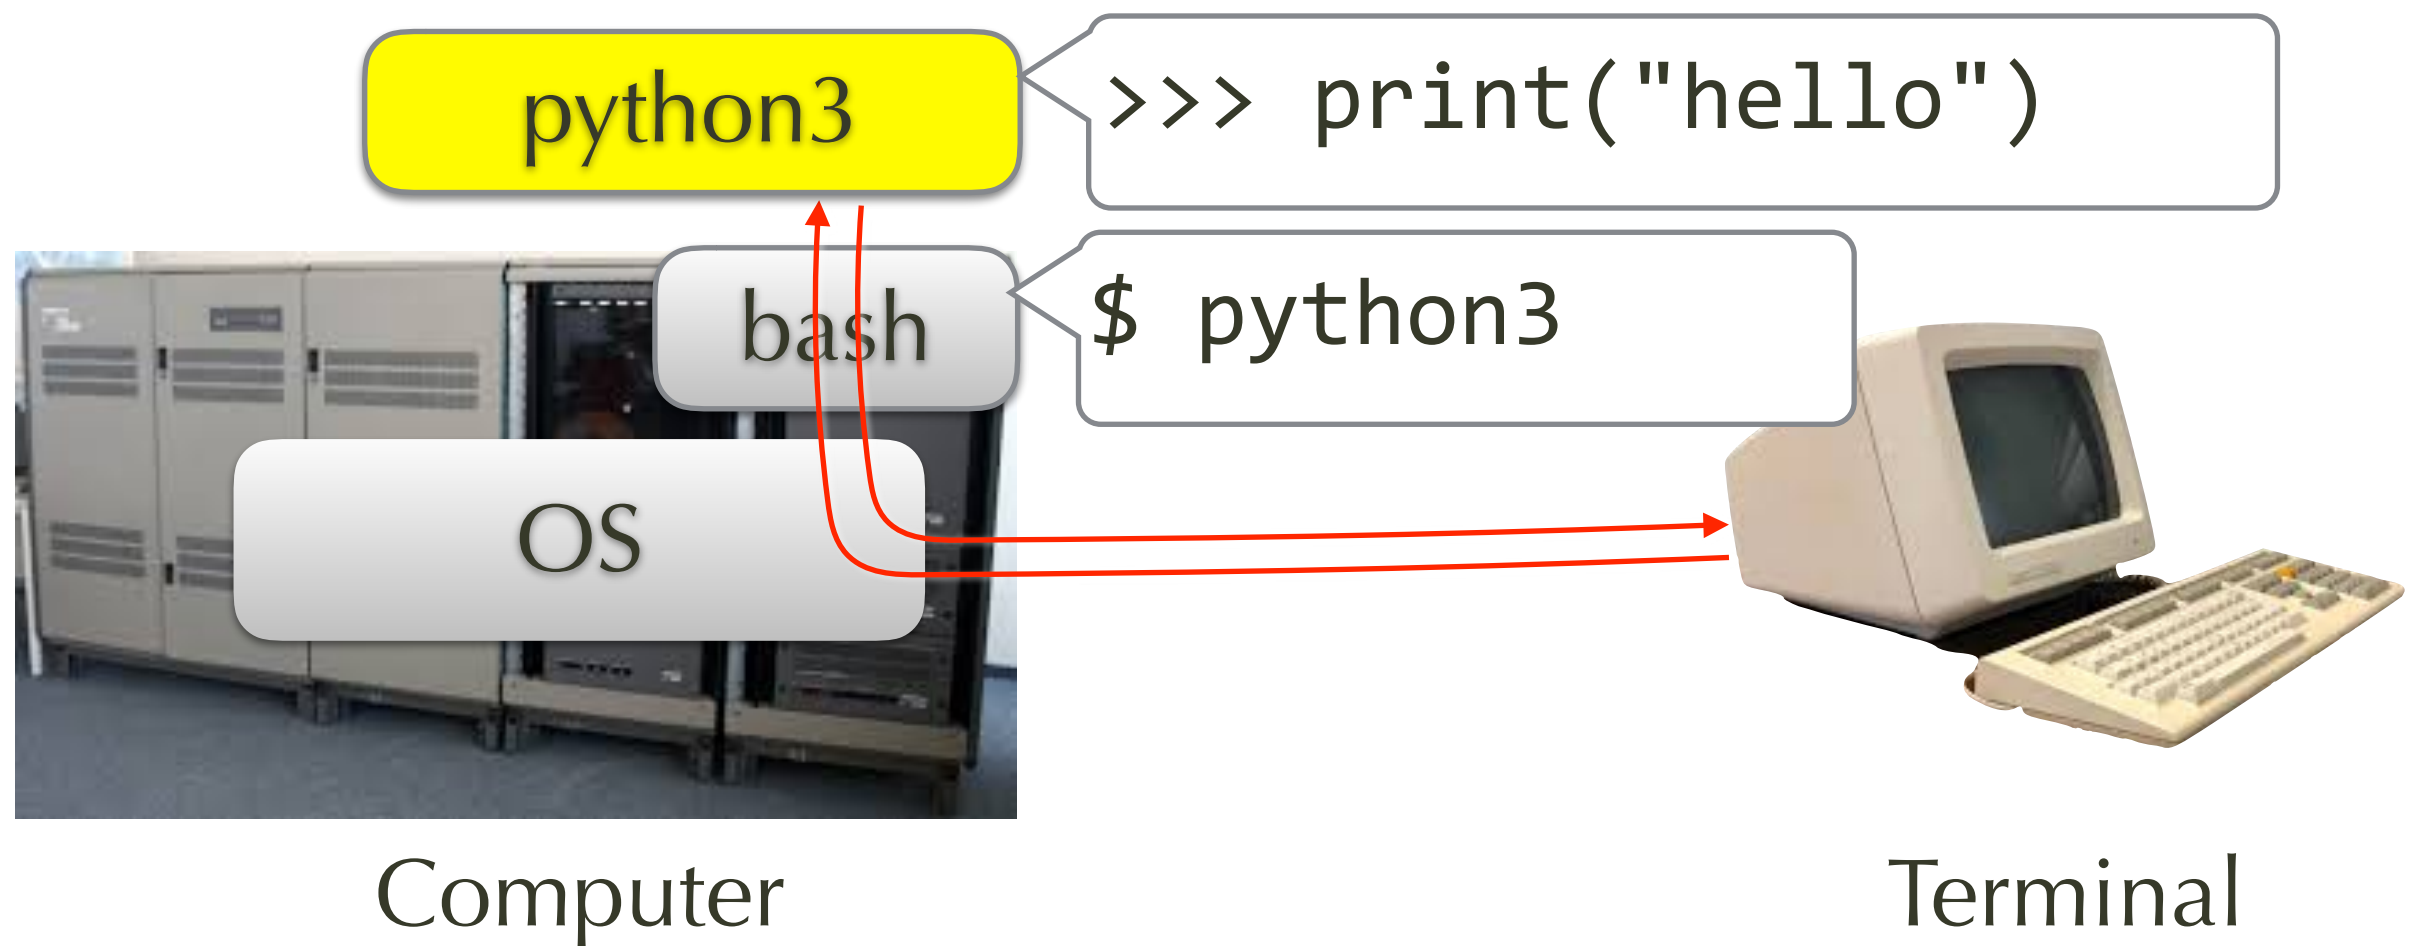

vim

- "Vi-improved"
 - Vi = "Visual" text editor, on most Unix systems
 - can edit, save plain text files (e.g., source in Python)

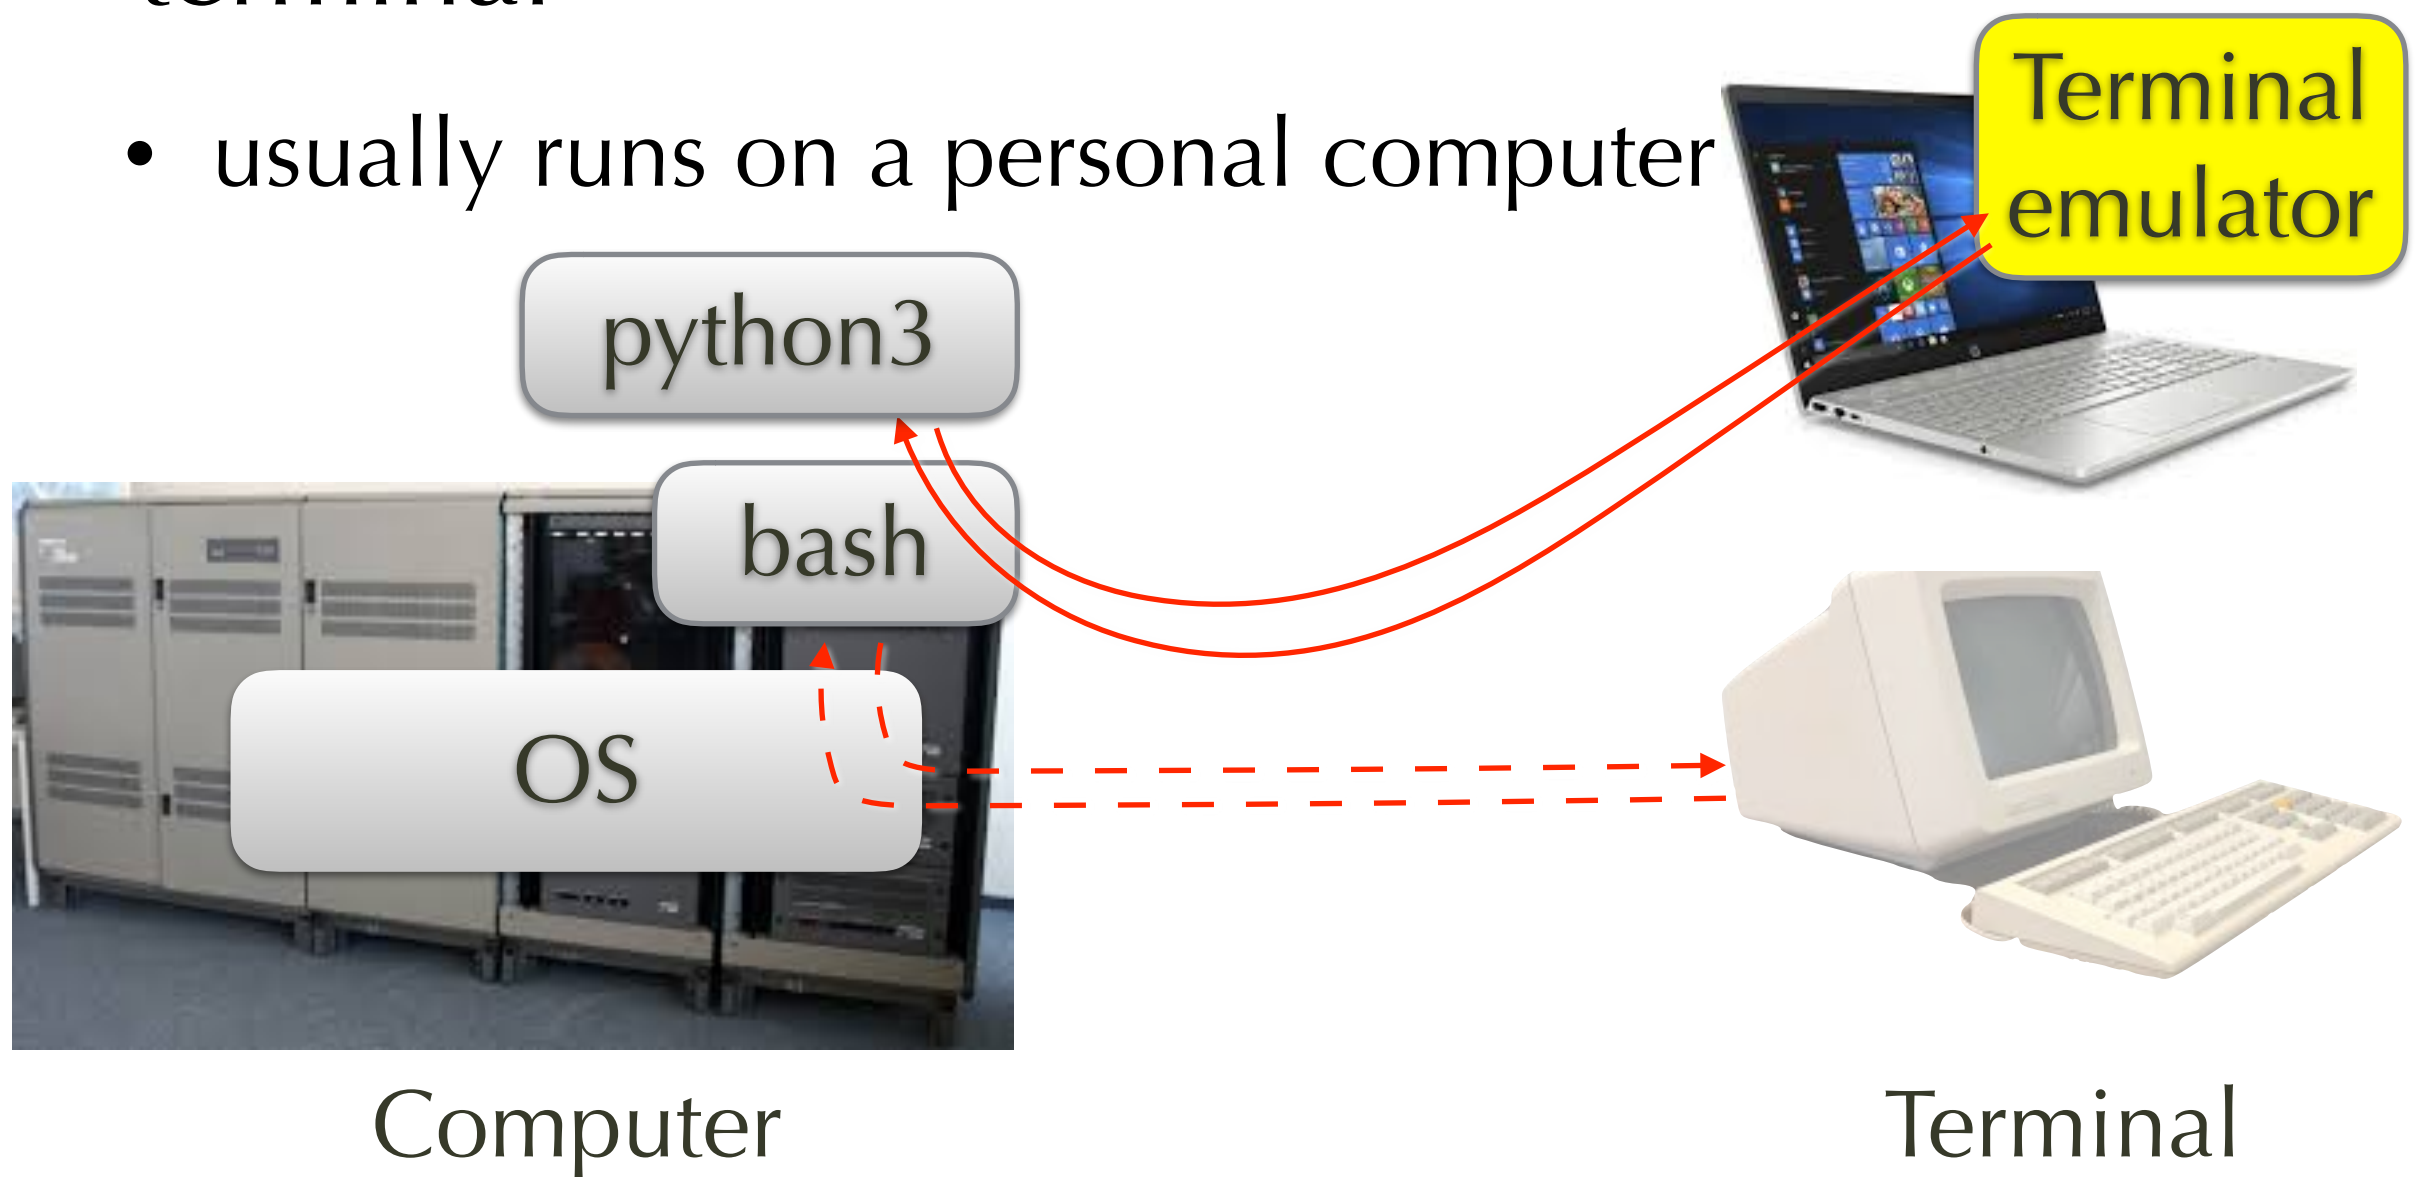

Python

- A Python-language interpreter
 - Interactive mode => Python shell

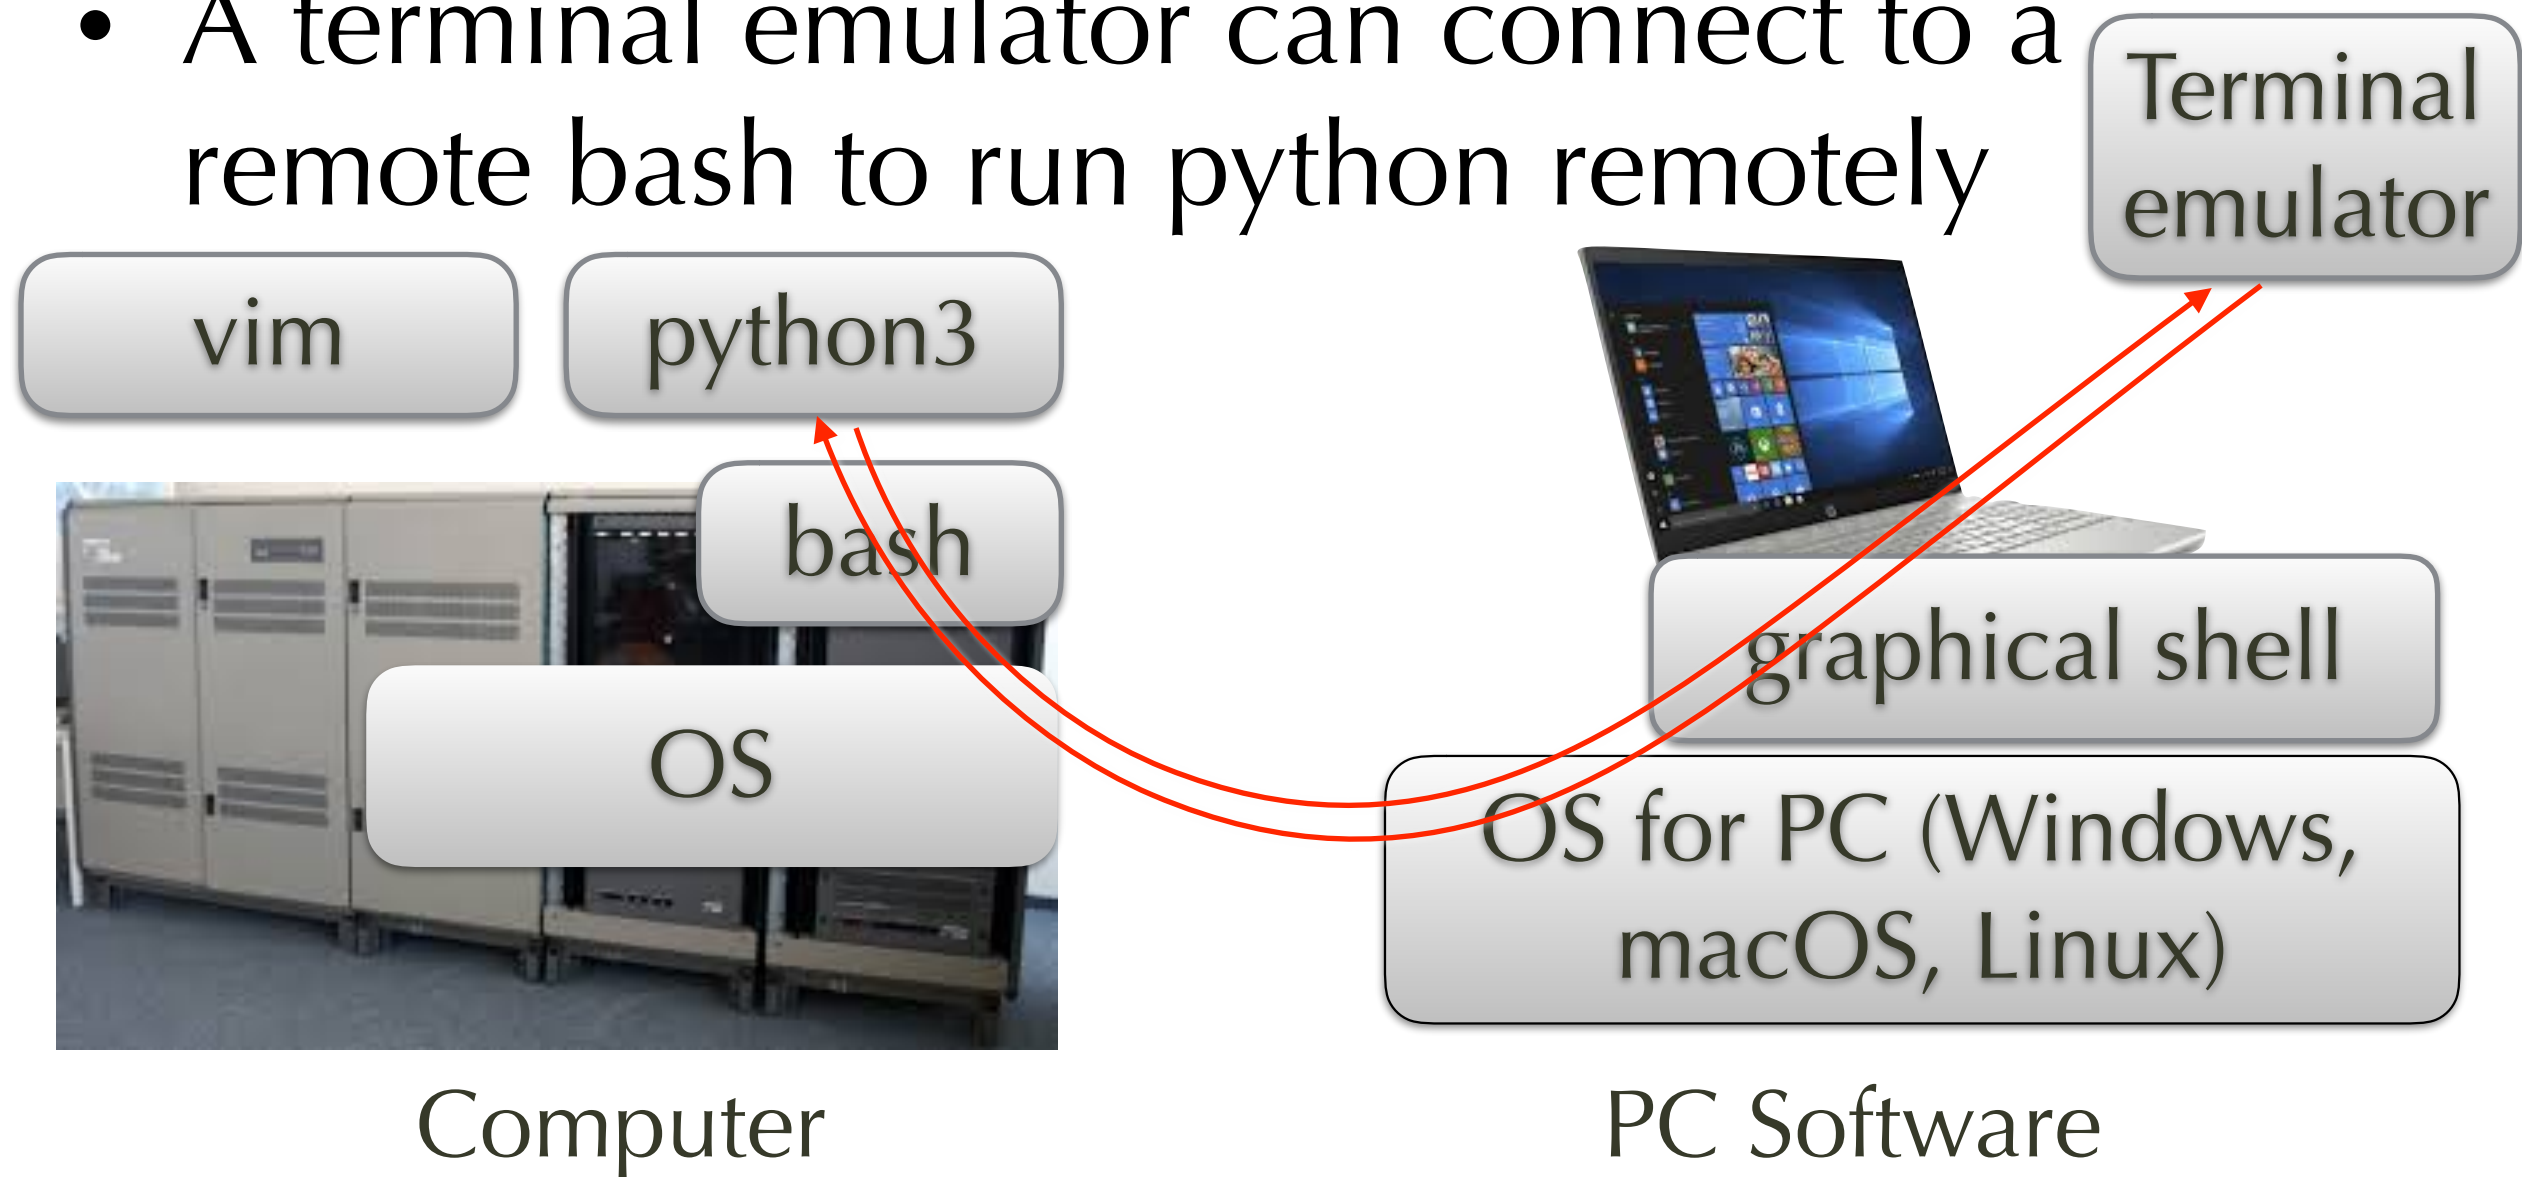

Terminal Emulator

- An application program that emulates a terminal
- usually runs on a personal computer

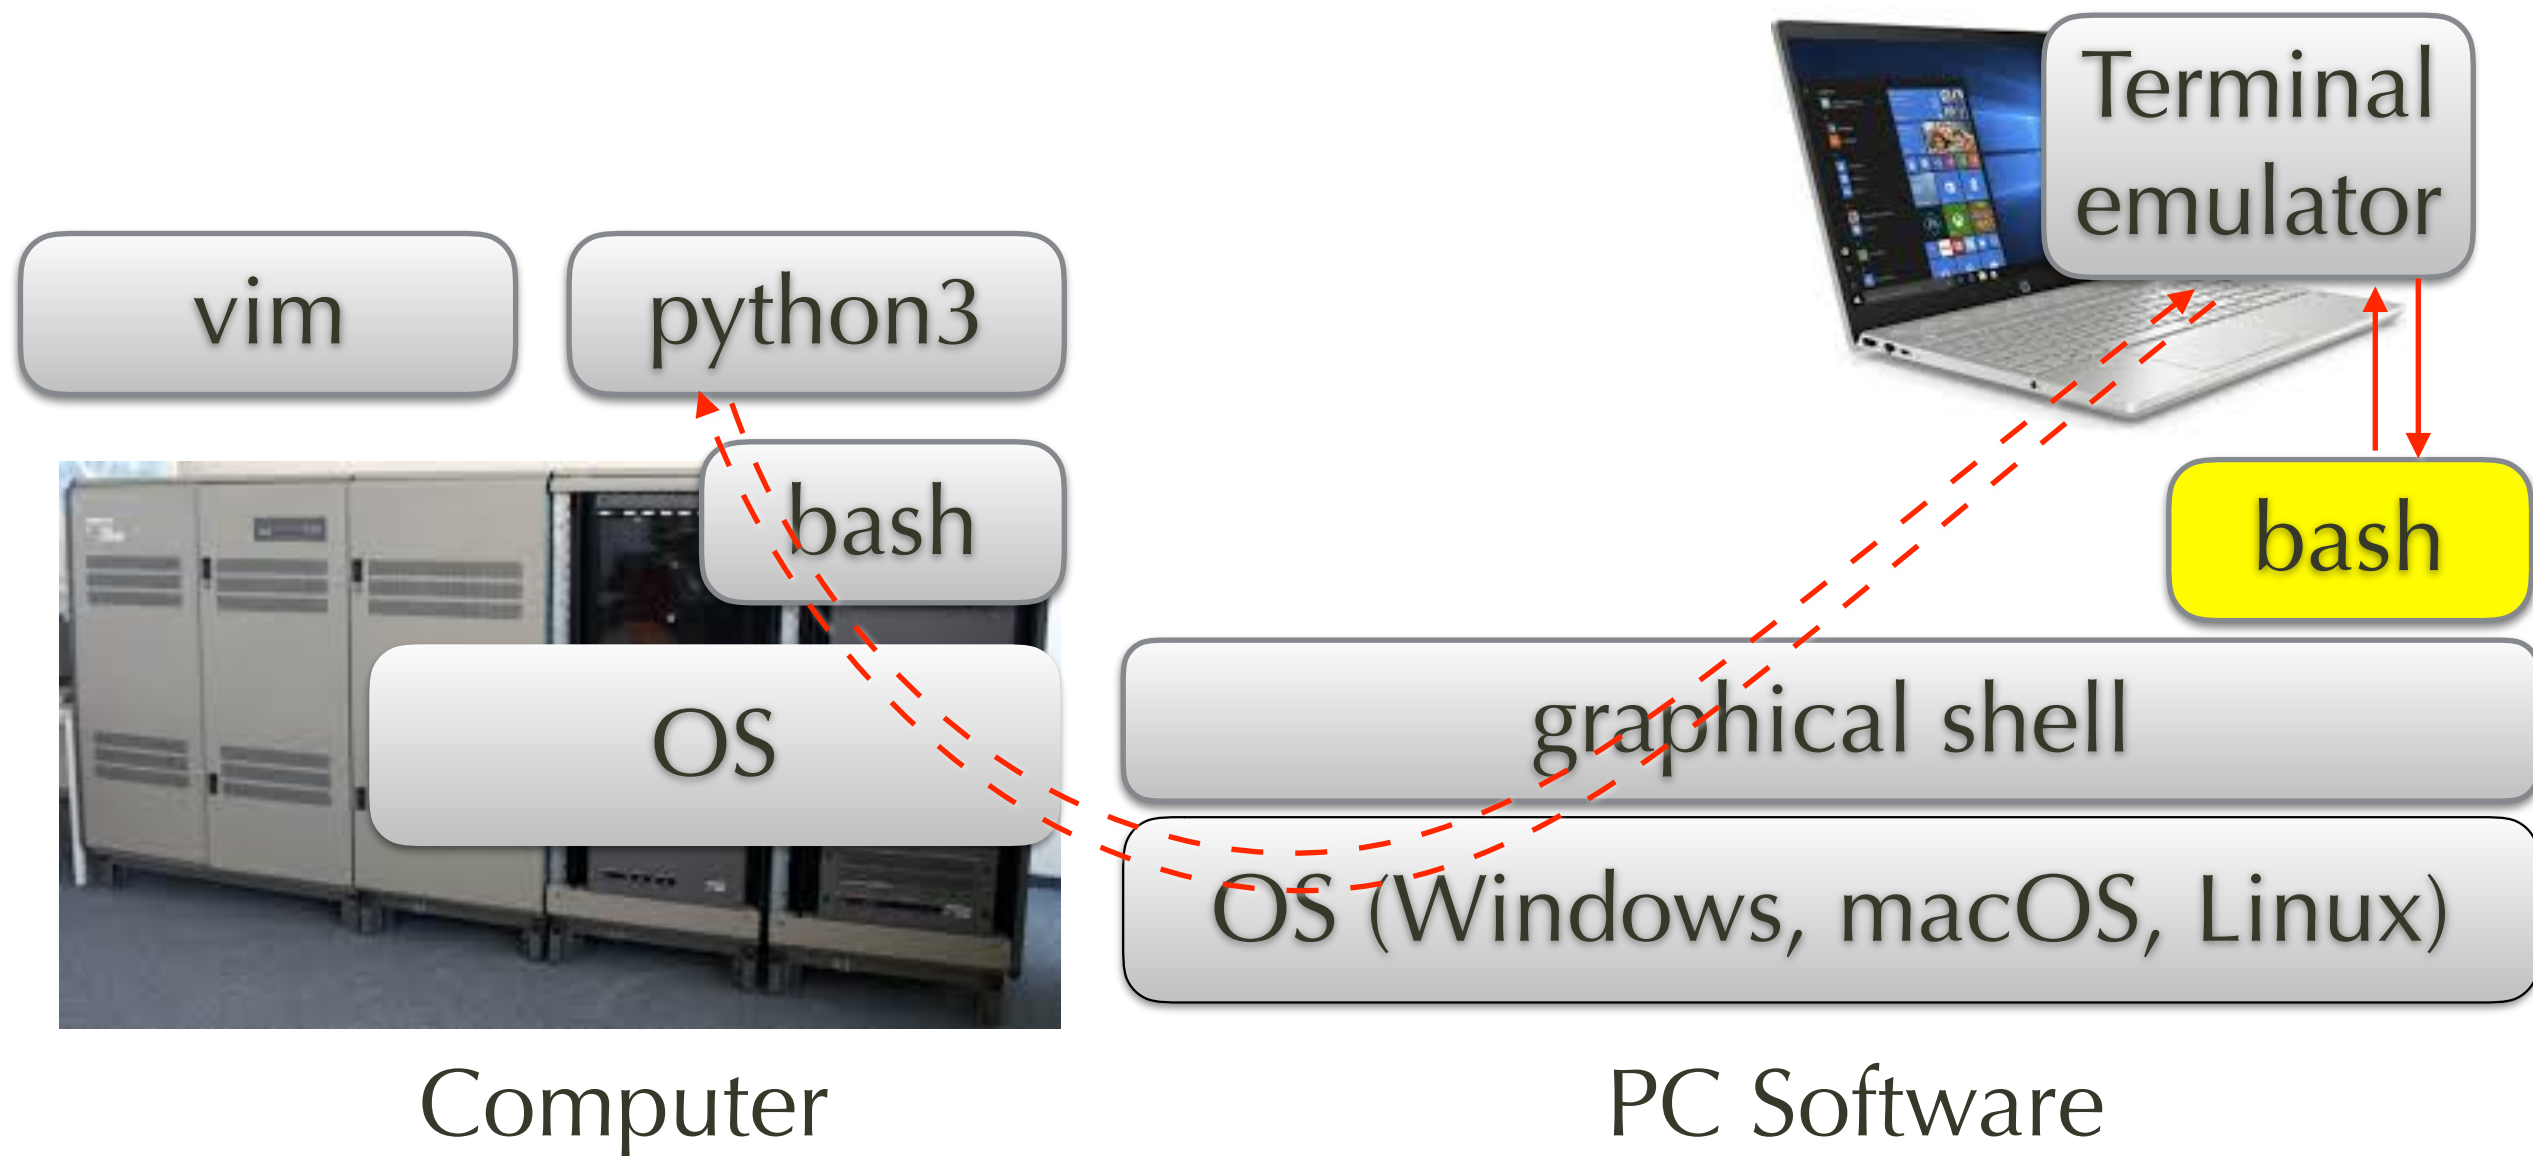

Personal Computer (PC)

- A computer that runs its own OS
- A terminal emulator can connect to a remote bash to run python remotely

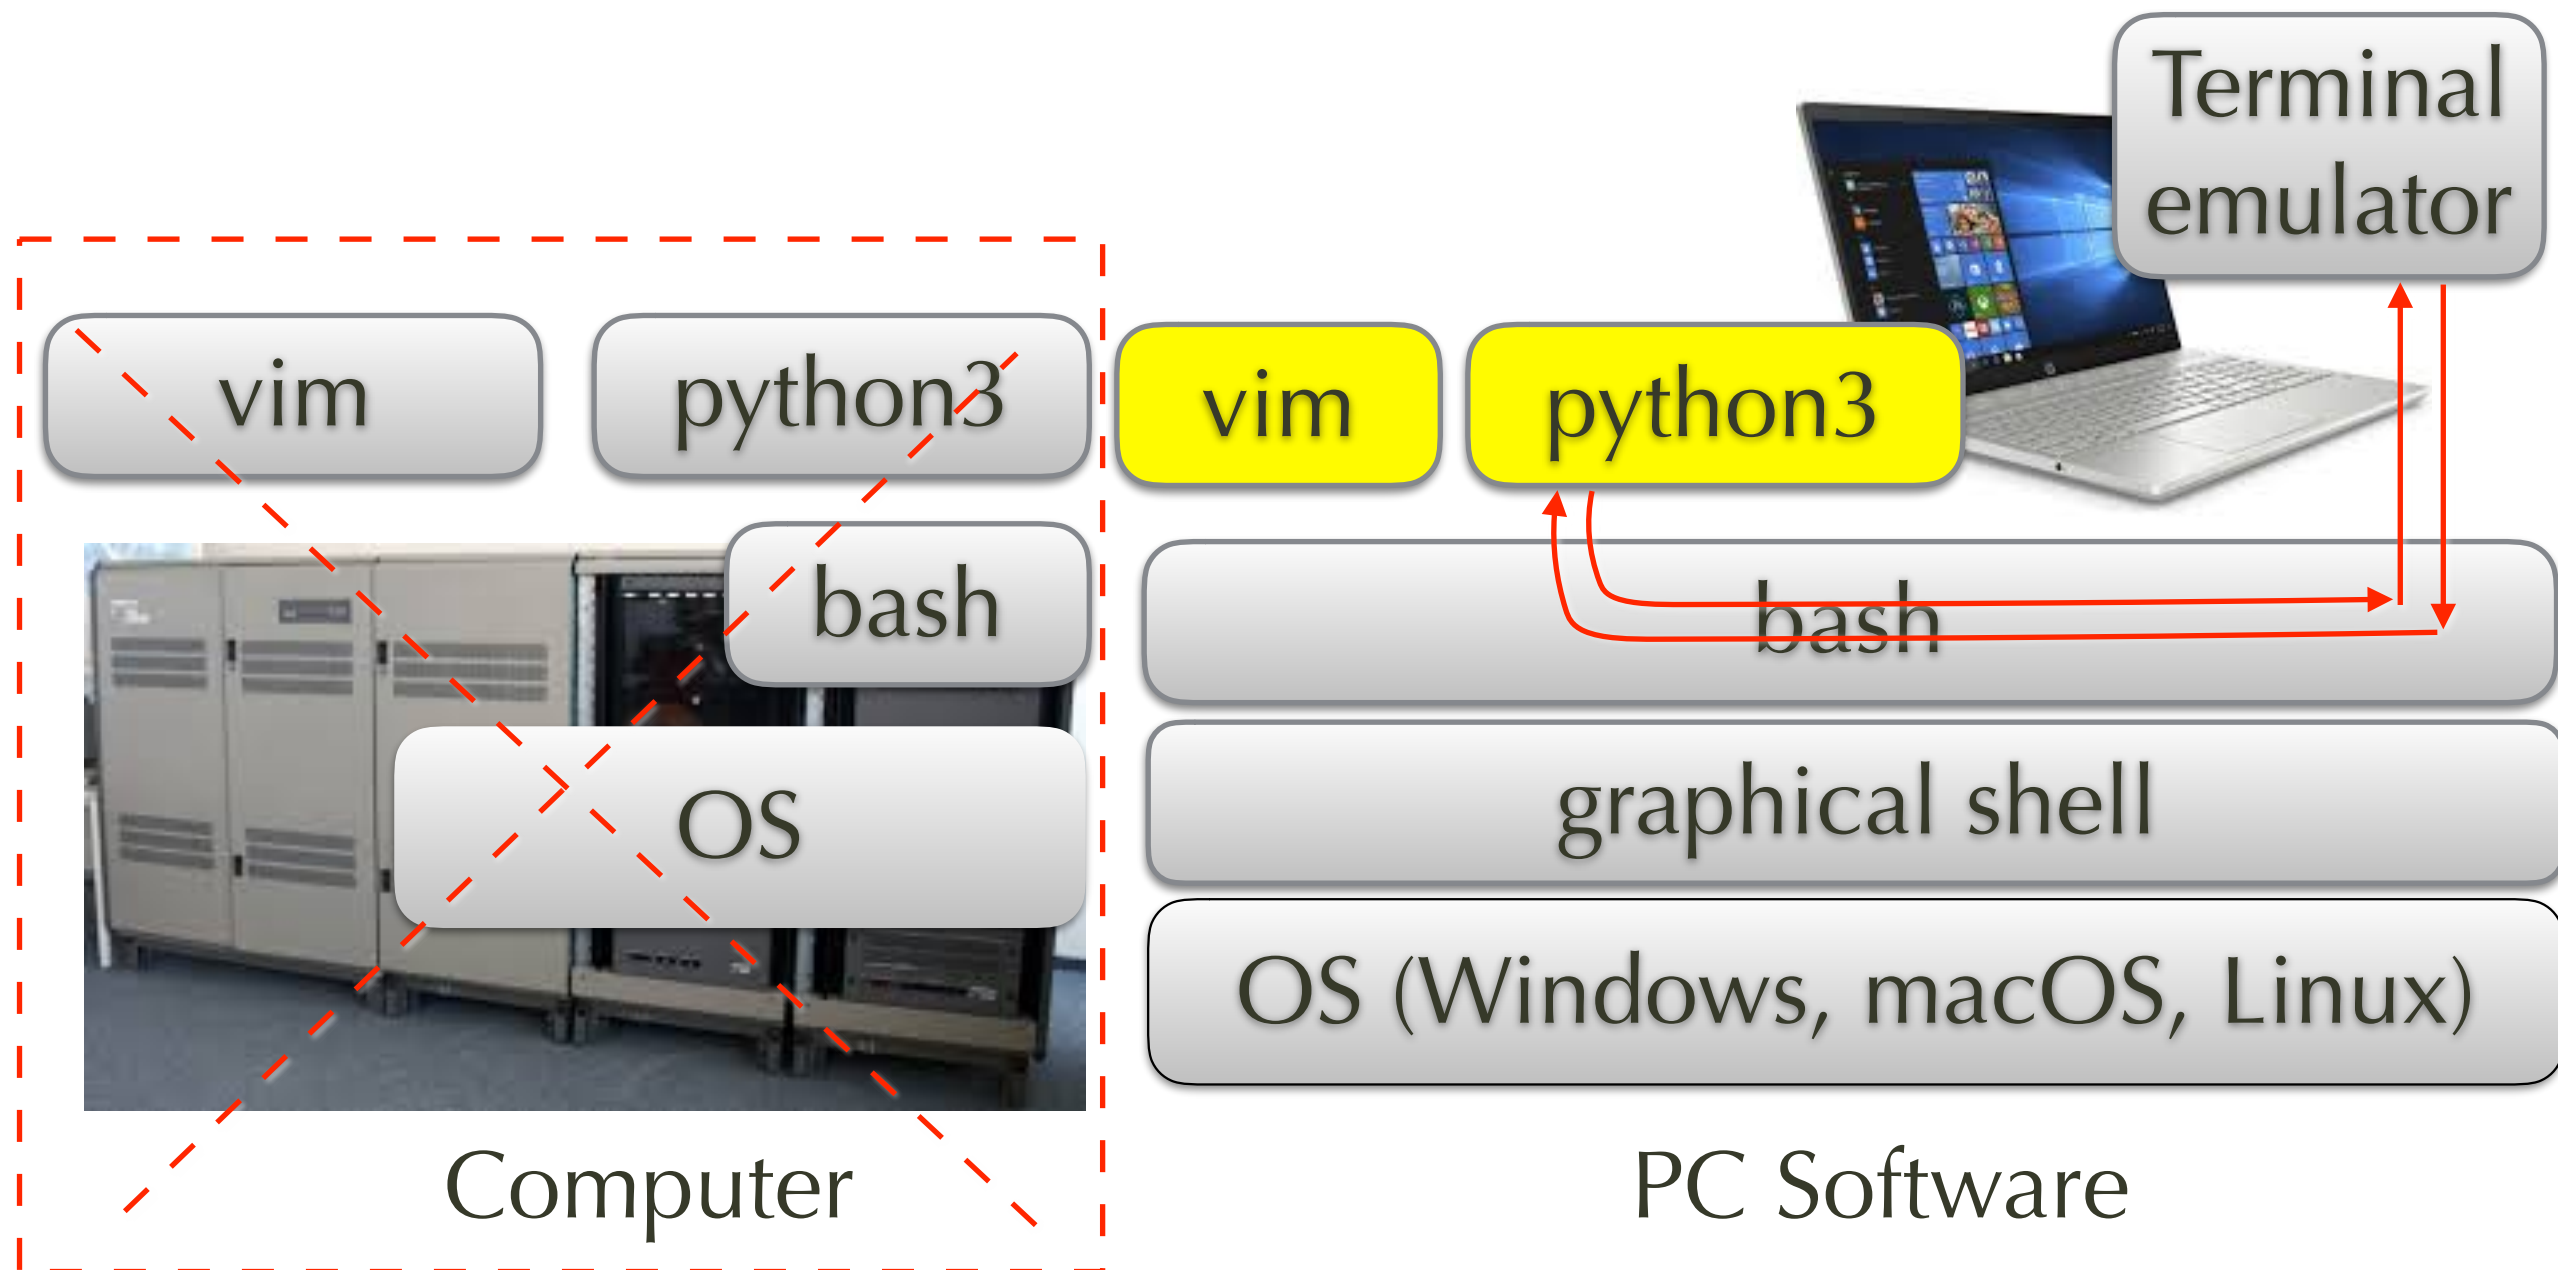

Local shell (on PC)

- PC can run its own bash locally

1. Local text-based software installation

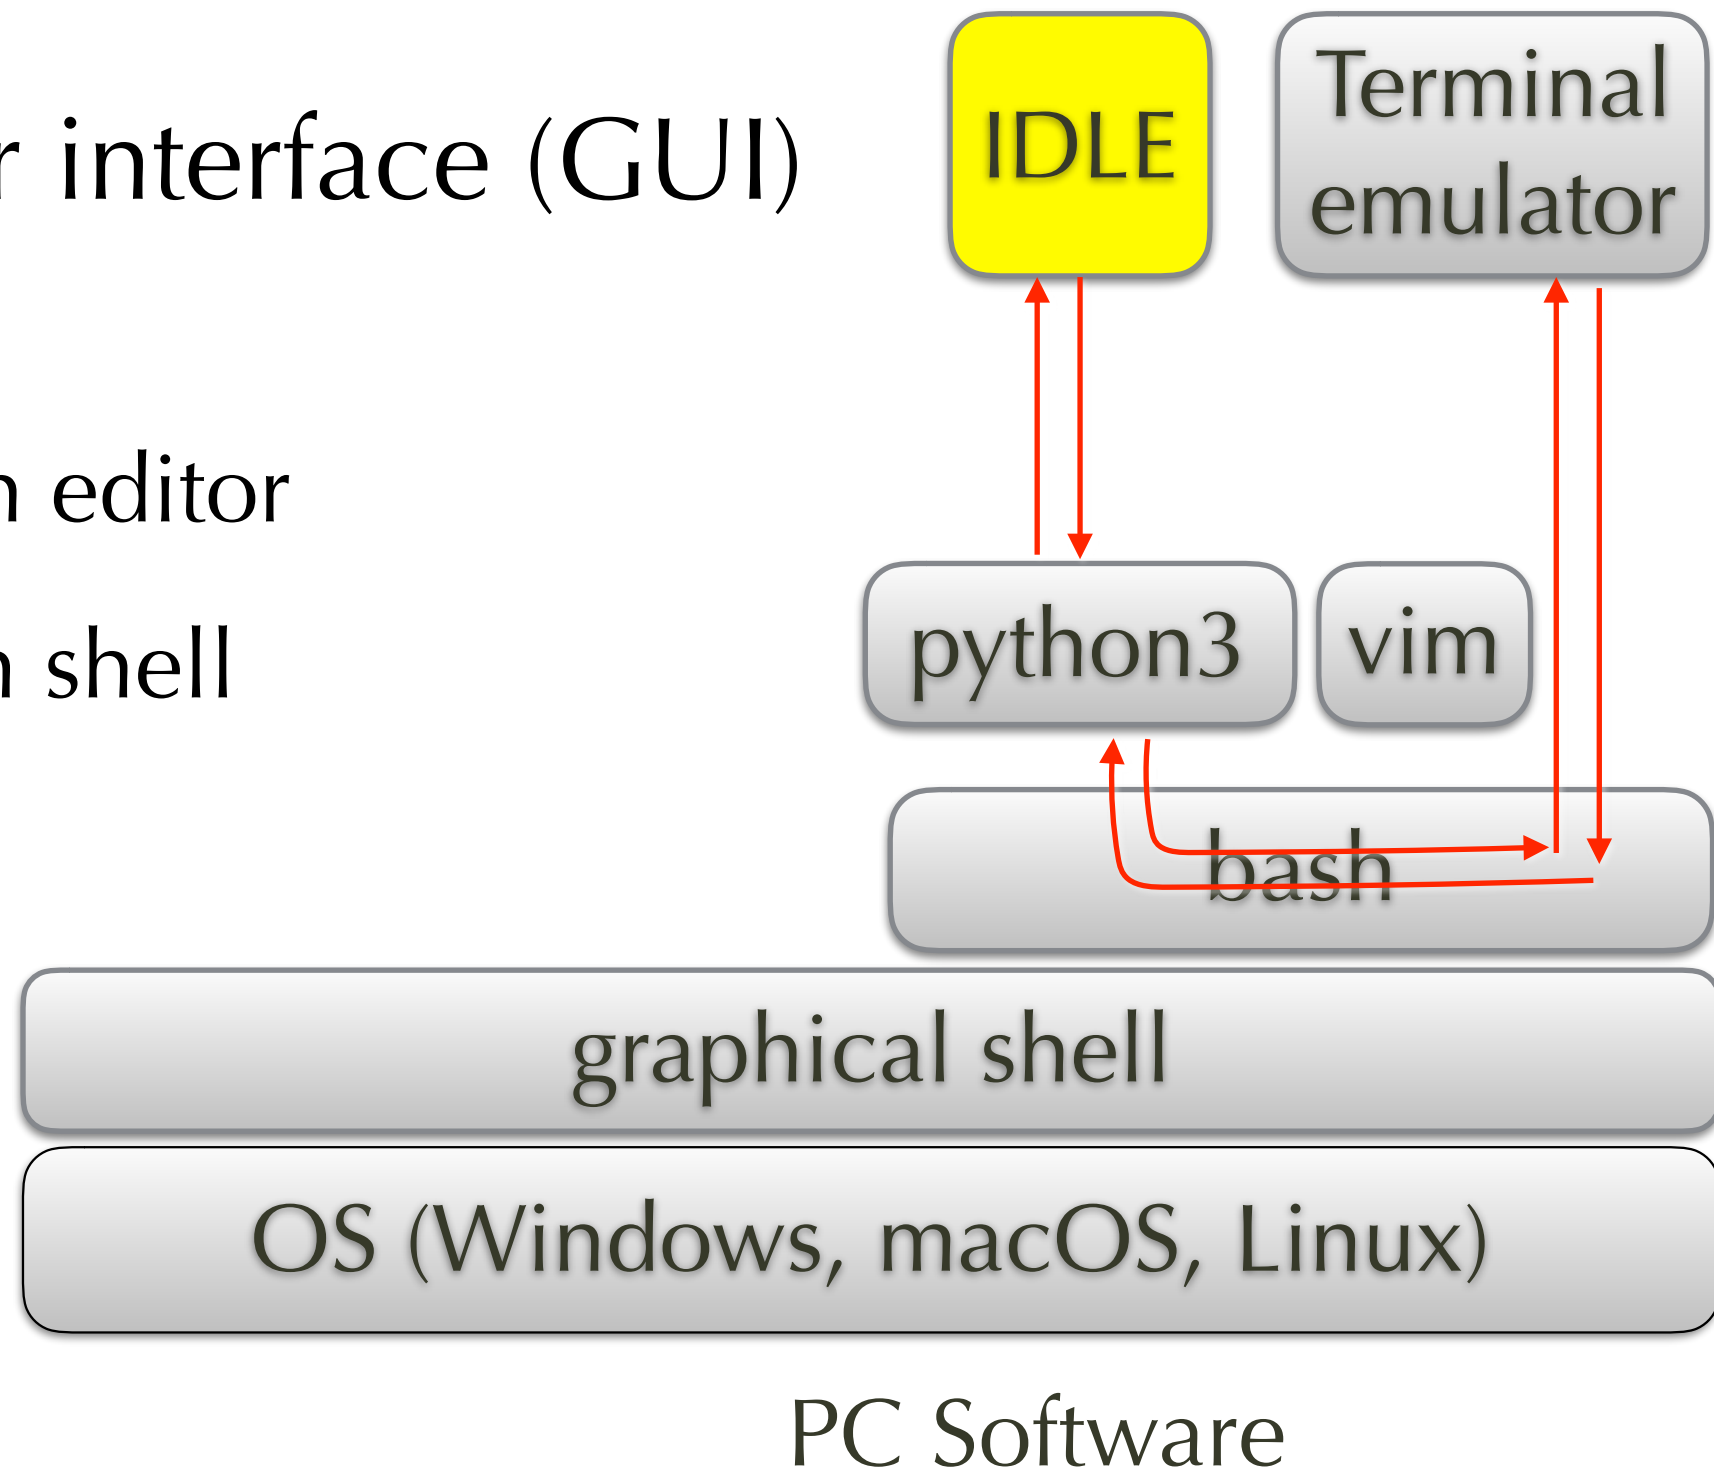

- Python3, vim, etc have been ported to PC

2. IDLE

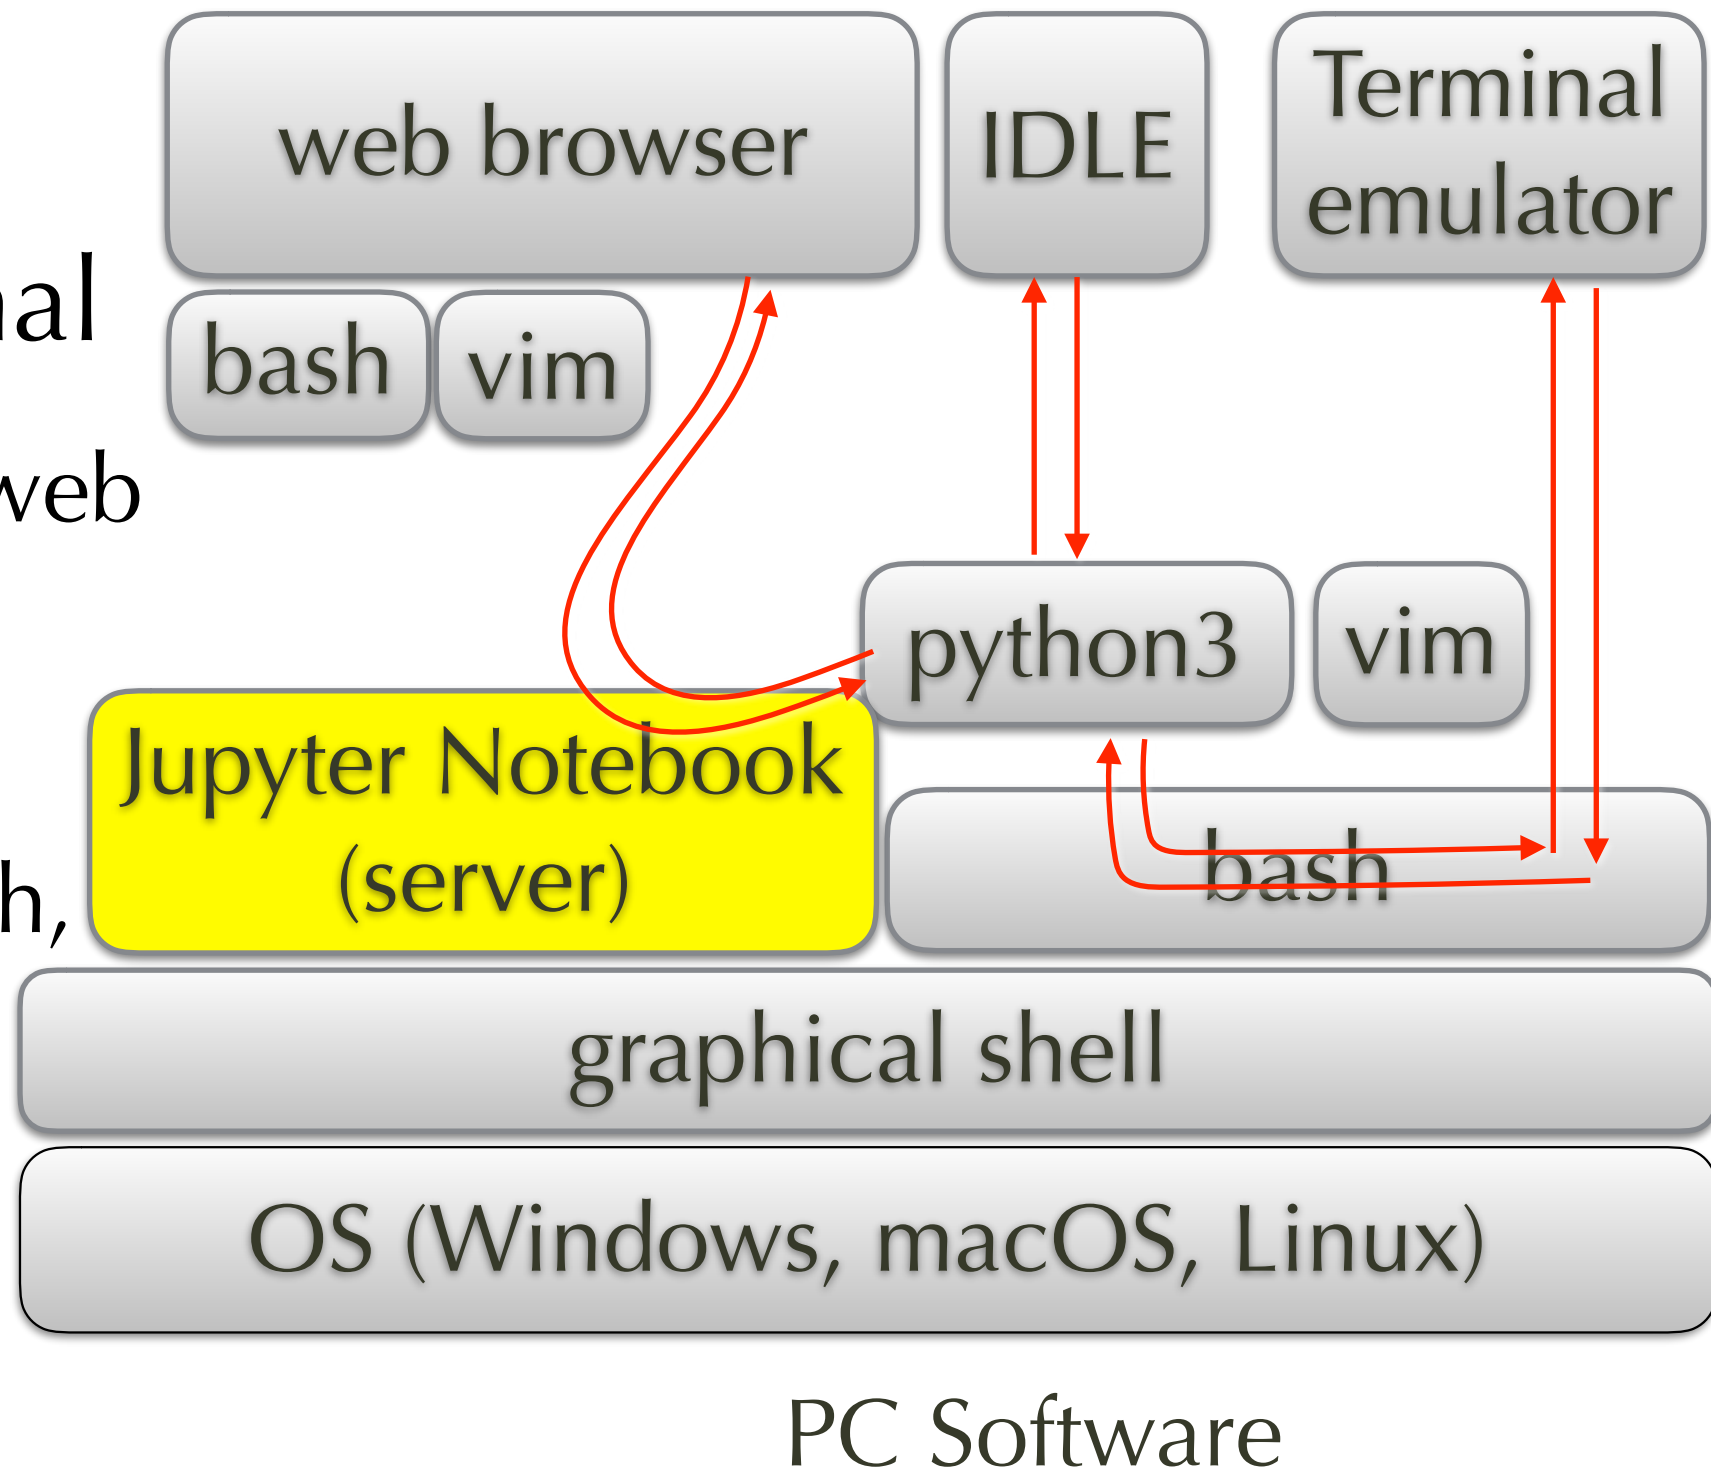

- Graphical user interface (GUI) for Python
 - contains built-in editor
 - provides Python shell

3. Jupyter Notebook

- Browser as graphic terminal
- runs as a local web server
- bash terminal, text editors, bash, file browser,

What should you install?

- #1 (Local text-based) for CS majors
 - may have learning curve, but worth it
- #2 (IDLE) for Non-CS majors
 - friendlier, but no access to bash CLI
 - ok for just learning Python only
- #3 (Jupyter) for both
 - Superset of #1, also brings in latest Python
 - You may need #1 to install Jupyter (macOS, Linux)
